

# BioProof-ID

## Identity Proofing and Verification

Introducing BioProof-ID, a new layer of confidence for your healthcare network security. Now confirm legal identity and monitor biometric induction in a single process chain. BioProof-ID's online remote authentication agents:

- Confirm user identity by viewing government issued ID
- Witness the confirmed user create a biometric password using BioSig-ID gesture biometrics to verify ID

The newly enrolled and confirmed user then accesses your network with their biometric password, a simple process of drawing four characters with finger or mouse.

### BioProof-ID for Healthcare:

- Remove barrier to reimbursement
- Provide proof of services
- Replace physical encounters
- Expand patient reach
- Secure your network with multi-factor authentication, the strongest technology that exists
- Reduce liability from hacking and privacy law violations common to other biometrics. Because BioSig-ID is a gesture biometric, it's replaceable any time and privacy-friendly
- Record sessions

#### Electronic Prescriptions for Controlled Substances (EPCS):

Independently tested by the Tolly Group to meet CFR 21 1311.116 "Additional Requirements for Biometrics" from the DEA's Interim Final Rule for Electronic Prescriptions for Controlled Substances.
